

## Cat Spay (Ovariohysterectomy)

Please read this pre-operative information sheet for cats and dogs

Before the procedure we would ask you read this document carefully to give you (the owner) the information required for the elected procedure. Every surgical procedure that is undertaken carries associated risks and complications. Although rare, we want you to be fully informed before you proceed.

The procedure your cat will be having today is called an ovariohysterectomy or more commonly called a cat spay. This surgical procedure involves removing the ovaries and the uterus or womb. Once this procedure has been performed it cannot be reversed. Benefits to your cat include:

1. Eliminates behaviours associated with, and permanently stop further seasons
2. Prevents unwanted pregnancies and reduces the urge to roam
3. May reduce aggressive instincts and therefore fighting
4. Eliminates infection of the womb (pyometra)

Please read the following list of complications that can result from this procedure and ask a member of staff if you have any questions or concerns. This list is not exhaustive. Should a complication arise, owners are liable for the costs associated with the complication.

1. Haemorrhage (bleeding) both during and after the procedure (inside or outside of the abdomen)
2. Wound break down
3. Wound infection
4. Bruising and swelling
5. Seroma (pocket of fluid)
6. Damage to internal organs including tying off ureters
7. Pain
8. Suture material reaction
9. Herniation
10. Anaesthetic complication including death
11. General anaesthesia requires intubation which has a recognised risk of inadvertent tracheal tear
12. Ovarian remnant remaining after surgery

Please be assured that we take every precaution to minimise these risks to your pet.
